Our traditional business was founded in 1932 in the Ruhrgebiet in Germany and was one of the first companies to develop and manufacture knee-protectors. As a responsible distributor of professional knee-protection in mining applications, we helped to develop the Mining Standard DIN 23311 in cooperation with the Standard Committee Mining in 1953. Accordingly, optimal protection for the user as well the high quality standard for knee-protectors were set in stone for us. Naturally the requirements of the new European standard DIN EN 14404 from the year 2005 have been accounted for, while preserving the old quality standards. With the registered trademark Wohltat™, our products still stand for high quality and robust knee-protectors for a spectrum of different users, which has grown wider over the decades.

#### Assortment

Our knee protection assortment  
Knee protection from Nierhaus – for an easy overview you can sort by the following categories: Do-It-Yourselfer Elbow protectors and back support belts Floor layers Gardeners and landscapers gardeners Knee cushions, Honey-comb cushion Mining Paviour, roadmakers and canal workers Shipbuilding Tilers and pavement-layers Tilers, slaters, painters, carpenters, interior decorators Welders  
They provide effective and durable protection for the knees in all types of

kneeling work. What began with the production of knee-protectors for mining applications, today represents a business which develops and produces knee-protectors for protection and safety in all manual labour.

Why kneepads? Safety for all occupationKnee pads decrease the risk of injuries by knee bruises, haematomas and abrasions considerable.On a long term basis they protect the workers knees from chronically diseases and signs of wear and tear that can cause incapacity to follow one´s profession. A perfectly manufactured and especially for each branche developed knee pad increase workers efficiency by allowing to work kneeling comfortable and painless.Workers often prefer to squat down than to work in a kneeling position. But from the medical point of view this is no alternative to a knee protection because of the overstretching of the ligament. The supporting surface and the soft embedding of the knee allocate the pressure regularly to knee cap and knee joint. This means a decreased risk of ruining the knee.
